

Lecture 3

§1 关于极限的 basic facts (接上次)

1. Fact 5 (子序列的极限)

Suppose $\lim_{n \rightarrow \infty} a_n$ exists and $\lim_{n \rightarrow \infty} a_n = l$. $n_1 < n_2 < \dots < n_k < \dots \rightarrow \infty$. Then for any subsequence $\{a_{n_k}\}_{k=1}^{\infty}$, we have $\lim_{k \rightarrow \infty} a_{n_k} = l$

证明:

$$\therefore \lim_{n \rightarrow \infty} a_n = l$$

$$\therefore \forall \varepsilon > 0, \exists N_\varepsilon \text{ s.t. } |a_n - l| < \varepsilon \text{ as long as } n \geq N_\varepsilon \quad (*)$$

$$\therefore n_k \rightarrow \infty \text{ as } k \rightarrow \infty$$

$$\therefore \exists K_\varepsilon, \text{ s.t. } n_k \geq N_\varepsilon \text{ as long as } k \geq K_\varepsilon$$

$$\text{By } (*), |a_{n_k} - l| < \varepsilon, \text{ if } k \geq K_\varepsilon$$

$$\therefore \lim_{k \rightarrow \infty} a_{n_k} = l$$

Q.E.D.

2. Fact 6 (sub-subsequence 的极限)

Suppose $\{a_n\}$ satisfies:

For any subseq of $\{a_n\}$, \exists sub-subseq $\{a_{n_k}\}_{k=1}^{\infty}$, s.t. $\lim_{k \rightarrow \infty} a_{n_k}$ exists and $\lim_{k \rightarrow \infty} a_{n_k} = l$, where l is independent of the choice of subseq.

Then $\lim_{n \rightarrow \infty} a_n$ exists and $\lim_{n \rightarrow \infty} a_n = l$.

证明:

Suppose otherwise. Then by rigorous definition of $\lim_{n \rightarrow \infty} a_n \neq l$,

$$\exists \varepsilon_0 > 0 \text{ and subseq } \{a_{n_k}\}_{k=1}^{\infty}, \text{ s.t. } |a_{n_k} - l| \geq \varepsilon_0, \forall k \geq 1 \quad (*)$$

By assumption, \exists sub-subseq $\{a_{n_{k_m}}\}_{m=1}^{\infty}$ s.t. $\lim_{m \rightarrow \infty} a_{n_{k_m}} = l$

$$\therefore \{a_{n_{k_m}}\}_{m=1}^{\infty} \subset \{a_{n_k}\}_{k=1}^{\infty}$$

$$\therefore \text{By } (*), |a_{n_{k_m}} - l| \geq \varepsilon_0, \forall m \geq 1$$

$$\therefore \lim_{m \rightarrow \infty} a_{n_{k_m}} \neq l \quad (\text{Contradiction})$$

Q.E.D.

注: 由 Fact 6 可知, the Converse of Fact 5 也是正确的. 即:

若 $\{a_n\}$ 的任一子序列极限均为 l , 则 $\{a_n\}$ 极限存在且为 l

§2 Preparation: 关于 boundness 的定义与性质

1. Definition: boundness (有界性)

Let S be a subset of \mathbb{R} ,

1° If \exists constant M s.t. $x \leq M, \forall x \in S$, then M is called the upper-bound of S .
We say S is bdd (bounded) from above. (上界)

2° If \exists constant M s.t. $x \geq M, \forall x \in S$, then M is called the lower-bound of S .
We say S is bdd from below.

3° If S is both bdd from above & below, then we say S is bdd.

2. **Definition:** least upper (greatest lower) bound (上确界/下确界)

Suppose S is bounded from above (below).

A real number s is said to be the least upper (greatest lower) bound of S , if:

1° s is an upper (lower) bound of S , i.e. $\forall x \in S, x \leq (\geq) s$

2° $\forall \varepsilon > 0, s - \varepsilon < x_\varepsilon (s + \varepsilon > x_\varepsilon)$, for some $x_\varepsilon \in S$.

e.g. $S = \{1 - \frac{1}{n}\}_{n=1}^{\infty} : 0, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \dots$

$$\sup S = 1$$

注: ① 对于序列 S , 上确界用 $\sup S$ 表示, 下确界用 $\inf S$ 表示.

② \forall upper bound M of S , we have $M \geq \sup S$

\forall lower bound m of S , we have $m \leq \inf S$

3. **Axiom:** The least upper bound axiom (上确界公理)

If S is bdd from above, then $\sup S$ exists.

若 S 有上界, 则上确界一定存在.

4. **Theorem:** 下确界定理

If S is bdd from below, then $\inf S$ exists.

若 S 有下界, 则下确界一定存在.

证明:

Let $T = -S$, then T is bounded above

By axiom, $\sup T$ exists, it satisfies:

$\forall -s \in T (s \in S)$, we have

$$-s \leq \sup T \Rightarrow s \geq -\sup T, \forall s \in S$$

$\forall \varepsilon > 0, \exists -s_\varepsilon \in T (s_\varepsilon \in S)$, s.t.

$$\sup T - \varepsilon < -s_\varepsilon \Rightarrow s_\varepsilon > -\sup T + \varepsilon$$

$\therefore -\sup T$ is $\inf S$

注: By-product:

$$\sup(-S) = -\inf S$$

$$\inf(-S) = -\sup S$$

§3 关于极限的 basic facts (接上)

1. **Fact 7** (单调有界序列极限存在: Monotone Convergence Theorem)

Suppose $\{a_n\}$ is monotone and is bdd. Then $\lim_{n \rightarrow \infty} a_n$ exists as a finite number.

证明:

Only consider the case of monotone increase.

(先利用上确界公理证出上确界为实数)

$$\text{Let } l = \sup \{a_n\}_{n=1}^{\infty}$$

$\therefore \{a_n\}$ is bdd from above

$\therefore l$ exists & l is finite

(随后利用上确界的定义证出极限存在)

By definition of Supremum,

$$\forall n, l > a_n$$

$$\forall \varepsilon > 0, l - \varepsilon < a_N \text{ for some } N$$

$\therefore a_n$ is monotone increasing.

$$\therefore l - \varepsilon < a_N \leq a_n \leq l < l + \varepsilon$$

$$\therefore |a_n - l| < \varepsilon, \text{ for } n \geq N$$

$$\therefore \lim_{n \rightarrow \infty} a_n = l$$

Q.E.D.

注: 若 a_n 单调递增且无界, 则 $\lim_{n \rightarrow \infty} a_n = +\infty$

证明:

$\therefore a_n$ is not bdd

$$\therefore \forall M, \exists \text{ some } n_m \text{ s.t. } a_{n_m} > M$$

$\therefore a_n$ is monotone increasing

$$\therefore a_n \geq a_{n_m} > M \text{ whenever } n \geq n_m$$

例 1: $a_1 = \sqrt{2}, a_2 = \sqrt{2+\sqrt{2}}, a_3 = \sqrt{2+\sqrt{2+\sqrt{2}}}, \dots \lim_{n \rightarrow \infty} a_n$ exists?

(Observe: a_n is monotone increasing

$$a_n \text{ is bdd: } \sqrt{2+\sqrt{2+\sqrt{2} \dots}} < 2)$$

proof by mathematical induction:

$$\cdot a_1 = \sqrt{2} < 2$$

\cdot assume $a_n < 2$, want to show $a_{n+1} < 2$

$$a_{n+1} = \sqrt{2+a_n} < \sqrt{2+2} = 2$$

By M.C.T., $\lim_{n \rightarrow \infty} a_n$ exists as a finite number.

$$\lim_{n \rightarrow \infty} (a_{n+1} \cdot a_{n+1}) = \lim_{n \rightarrow \infty} (2 + a_n), \forall n$$

$$(\lim_{n \rightarrow \infty} a_n) \cdot (\lim_{n \rightarrow \infty} a_n) = 2 + \lim_{n \rightarrow \infty} a_n$$

$$\lim_{n \rightarrow \infty} a_n = 2 \text{ or } -1$$

$$\text{Since } a_n > 0, \lim_{n \rightarrow \infty} a_n = 2$$

例 2: Prove that $\lim_{n \rightarrow \infty} (1 + \frac{1}{n})^n$ exists as a finite #

(先证明 $(1 + \frac{1}{n})^n$ 递增)

Claim 1: $\{(1 + \frac{1}{n})^n\}$ is \uparrow

$$\begin{aligned} (1 + \frac{1}{n})^n &= 1 + n \cdot \frac{1}{n} + \frac{n(n-1)}{2!} (\frac{1}{n})^2 + \dots + \frac{n(n-1)\dots 1}{n!} \cdot (\frac{1}{n})^n \\ &= 1 + 1 + \frac{1}{2!} \cdot 1 \cdot (1 - \frac{1}{n}) + \dots + \frac{1}{n!} \cdot 1 \cdot (1 - \frac{1}{n}) \cdot (1 - \frac{2}{n}) \dots (1 - \frac{n-1}{n}) \\ &< 1 + 1 + \frac{1}{2!} \cdot 1 \cdot (1 - \frac{1}{n+1}) + \dots + \frac{1}{n!} \cdot 1 \cdot (1 - \frac{1}{n+1}) (1 - \frac{2}{n+1}) \dots (1 - \frac{n-1}{n+1}) \quad (*) \\ &< (*) + \frac{1}{(n+1)!} \cdot 1 \cdot (1 - \frac{1}{n+1}) \cdot (1 - \frac{2}{n+1}) \dots (1 - \frac{n}{n+1}) \\ &= (1 + \frac{1}{n+1})^{n+1} \end{aligned}$$

\Rightarrow Claim 1

Claim 2: $\{(1 + \frac{1}{n})^n\}$ is bdd (from above)

$$\begin{aligned} (1 + \frac{1}{n})^n &= 1 + n \cdot \frac{1}{n} + \frac{n(n-1)}{2!} (\frac{1}{n})^2 + \dots + \frac{n(n-1)\dots 1}{n!} \cdot (\frac{1}{n})^n \\ &= 1 + 1 + \frac{1}{2!} \cdot 1 \cdot (1 - \frac{1}{n}) + \dots + \frac{1}{n!} \cdot 1 \cdot (1 - \frac{1}{n}) \cdot (1 - \frac{2}{n}) \dots (1 - \frac{n-1}{n}) \\ &< 1 + 1 + \frac{1}{2!} \cdot 1 \cdot (1 - \frac{1}{n+1}) + \dots + \frac{1}{n!} \cdot 1 \cdot (1 - \frac{1}{n+1}) (1 - \frac{2}{n+1}) \dots (1 - \frac{n-1}{n+1}) \\ &< 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \dots + \frac{1}{n!} \\ &< 1 + 1 + \frac{1}{2} + \frac{1}{2^2} + \dots + \frac{1}{2^{n-1}} \\ &= 1 + \frac{1 - (\frac{1}{2})^n}{1 - \frac{1}{2}} \\ &< 3 \end{aligned}$$

\Rightarrow Claim 2

Now by MCT, $\lim_{n \rightarrow \infty} (1 + \frac{1}{n})^n$ exists as a finite #
